INKJET²FILM

For Film Positives

Works With All InkJet Printers

Fast Drying - Durable

Used to produce high quality film positives for screen printing

Instructions:

Place Film in your ink jet printer with the specially coated side in printing position. The specially coated, printable side has a rougher feel.

You should experiment with your printer's settings to achieve the most dense black ink laydown possible for your positives.

Most printers will give a better result when set to "Heavy Matte paper" *Matte Paper" or even "Plain Paper". If your printer has a "black ink only" setting, use it. Also set your "contrast" and "brightness" at the lowest setting if your printer has these settings. This will avoid pinholes and produce a dense black.

Glossy film or transparency settings may *not* be optimum because the printer may output less ink when set to print on glossy surfaces.

With most printers, you should be able to "fool" the printer into giving you the perfect amount of ink.

If you are ordering for the first time, request a sample pack to practice on so you will be ready when you start outputting for real.

Good luck, and give us a call if you have any questions.
